Trans. of Kolloid Zeitschrift (West Germany) 1960, v. 169, no. 1/2, p. 34-41.

An automatic sedimentation scale is described, where a closed cylinder is immersed in the suspension to be analyzed. It is equipped with a diagram recorder which draws a cumulative sedimentation curve in the form of a stepped curve. The sedimenting material itself repeatedly reduces the paper speed of the diagram strip in such a way during settlement, that a simple graphic evaluation with high accuracy is possible. The apparatus permits carrying out grain distribution analyses in a range from 0.1 to 10 μ .

Glass containing cerium was added to the metal in a
Fourcault tank at specific points and in a specific form.
Because of the cerium fluorescence, it is possible to
establish the position of the glass containing cerium in
the glass sheet and to draw conclusions in regard to the
currents in the tank. In the first example, it is de-
scribed how a fault in a tank brick causing bubbles in
the glass can be demonstrated. In the second example,
